PLANOS TOPOGRÁFICOS NACIONALES

POR SANTIAGO MUÑOZ

CONSTRUCCIÓN GRÁFICA DE PROYECCIONES POLICÓNICAS
DENTRO DE ÁREAS LIMITADAS

Habiéndo fijado los meridianos i paralelos límites i la escala, se traza por cualquiera recta el meridiano A A' mas próximo al meridiano medio. En seguida se aplican sobre este meridiano, tomándolas de las tablas, las distancias meridianas 0-1 i 1-2 entre el paralelo medio i los estremos. Por los tres puntos así determinados, se trazan perpendiculares al meridiano central i de cada uno de los puntos 0, 1, 2, se aplican a ambos lados sobre la perpendicular las abcisas X,X'... X,₁,X'₁... X,₂,X'₂ etc., i en el estremo de ellas las ordenadas YY'... Y,₁Y'₁... Y,₂Y'₂... determinando los puntos M,M'... etc., que corresponden a cada paralelo, los que unidos M' con M', i M'₁, etc., forman el respectivo meridiano.

APLICACION A LAS ESCALAS TOPOGRÁFICAS

Siempre que la escala topográfica sea superior a $\frac{1}{100,000}$, no hai objeto práctico en emplear una proyección geográfica como es la policónica. En efecto, los trapecios construidos por proyección poliedrica o natural de una carta al 100,000 de las mayores dimensiones de un mapa mural sea de 4 m. de costado, pueden reunirse sobre una superficie plana sin mas deformacion que $\frac{1}{2}$ milímetro en los estremos del papel, lo cual es mui inferior a la deformacion material del papel mismo. En las cartas cuya escala es mayor que $\frac{1}{20,000}$, raras veces se señalan los meridianos i paralelos, i para las comprendidas entre $\frac{1}{20,000}$ i $\frac{1}{100,000}$ se empleará la proyección poliedrica.

Ahora bien, podemos considerar que para las escalas siguientes se señalan los meridianos i paralelos a intervalos que varían de $5'$ a 1° , correspondientes a las dimensiones que se expresan en el cuadro siguiente, en latitud i lonjitud:

| Escalas | Intervalo | En latitud | | En lonjitud | |
|----------------|-------------------|------------|------------------|-------------|----------|
| | | 55° | lat. 20° | lat. 20° | lat. 55° |
| 100,000°..... | 5 minutos... | 92.2.... | 87.21.... | 53.3 | |
| 250,000..... | 15 » | 111.1.... | 104.6 | 64.0 | |
| 500,000..... | 30 » | 111.1.... | » » | » | |
| 1.000,000..... | 1 grado..... | 111.1.... | » » | » | |

Con los datos contenidos en las Tablas se pueden trazar los meridianos de $5'$ en $5'$ a cada lado hasta 2° , lo que equivale, en el caso mas desfavorable, en latitud de 55° a un ancho total de 2.56 m. para la escala de $\frac{1}{100,000}$ i 0.51 m. para el de $\frac{1}{500,000}$.

Para las escalas superiores a $\frac{1}{1,000,000}$ pueden trazarse los meridianos hasta 30° a cada lado, que es mas que suficiente para una carta de toda la América del Sur.

DIVISION EN HOJAS DEL MAPA DE CHILE

La faja I vertical corresponde al intervalo entre los meridianos 66° i $66^\circ 30'$ de lonjitudes.

La faja XV, al intervalo entre 73° i $73^\circ 30'$.

La faja 1 longitudinal, corresponde al intervalo entre

| | | |
|--------------------|----------------|-------------|
| los paralelos | $18^\circ-00'$ | Latitud Sur |
| | $18^\circ-15'$ | |
| | $18^\circ-15'$ | |
| La faja 2, entre | $18^\circ-30'$ | |
| La faja 100, entre | $42^\circ-45'$ | |
| | $43^\circ-00'$ | |

A la escala de 1 : 3.000,000

| Lat. | Largo de los grados de latitudes | Primer grado de longitud | | | | Segundo grado de longitud | | | |
|------|--|--------------------------|-------------|-----------------|---------------|---------------------------|----|----|----|
| | | X | | X | | X | | X | |
| | | m. | m. | m. | m. | m. | m. | m. | m. |
| 30° | | 96,487 = 0,032 | 421 = 0,000 | 192967 = 0,0643 | 1684 = 0,0006 | | | | |
| | 110857 = 0,0336 | | | | | | | | |
| 31° | | 95,505 = 0,032 | 429 = 0,000 | 191002 = 0,0637 | 1717 = 0,0006 | | | | |
| | 110874 = 0,0332 | | | | | | | | |
| 32° | | 94,494 = 0,0315 | 437 = 0,000 | 188980 = 0,0629 | 1748 = 0,0006 | | | | |
| | | | | | | | | | |

Trazaremos una línea que atraviese la hoja por su parte media, la que representará el eje de las Y o meridiano medio central; se colocarán sobre dicho meridiano los largos de cada grado de latitud, 110857 m., i 110874 m., como lo indica la figura ilustrativa anterior; por esos tres puntos señalados se trazarán perpendiculares a un lado i al otro del meridiano, cuyas líneas indicarán la dirección este a oeste, debiéndose comprobar su paralelismo por medio de diagonales.

En las últimas dos columnas de cada página de la derecha de las tablas, tituladas «Coordenadas», se obtienen las abcisas (X) i ordenadas (Y) para las latitudes de 30°, 31° i 32°, ya copiadas en el registro de arriba, i para 1° i 2° de longitudes.

Desde el punto que indica los 30° de latitud se colocarán hacia la derecha e izquierda los valores de las abcisas (X) para 1° i 2° de longitudes, 96487 m. i 192967 m., de cuyos puntos señalados se bajarán perpendiculares, que serán paralelas al meridiano central sobre las que se colocarán las ordenadas (Y), m. 421 i m. 1684, i por los dos puntos así determinados se trazará el paralelo correspondiente a los 30° de latitud sur.

Iguales operaciones se harán para determinar los paralelos que pasen por los 31° i 32° de latitud. Se unirán en seguida los puntos determinados por medio de las coordenadas, los cuales indicarán los meridianos que distan 1° i 2° del meridiano central.

Si se quisieran tener parcelas de $20'$ por lado, se dividirá en tres partes iguales cada lado de las cuadriculas de 1° , como lo indica la figura anterior; si se desean cuadros de $10'$ por $10'$, se les podrá dividir en seis partes iguales, i así en seguida.

PROYECCION NATURAL O POLIÉDRICA
APLICADA A LA FORMACION DE LA CARTA DE CHILE
EN ESCALA DE 1:100,000

Traducido de (*Istruzioni sulla proiezione naturale applicata alla formazione delle Carte d'Italia*)

Las hojas de la Carta de Chile en escala de 1:100.000, segun el desarrollo poliédrico o natural, deben estar limitadas por meridianos que disten $30'$ en el sentido de la lonjitud i por paralelos que disten $15'$ en el de la latitud, formando cuadros de 0.55 m. x 0.45, m. iguales a los adoptados para la Carta de Francia, en la escala ya citada.

Las coordenadas jeográficas de los centros i extremos de cada hoja se encuentran en el mapa anexo de union, en el cual se enumeran tambien las hojas i trazados de los meridianos i paralelos que las determinan.

A la escala de 1:100,000, los meridianos i paralelos pueden considerarse como rectilíneos en cada hoja, por cuyo motivo las cuadriculas de $5'$ de lonjitud por $5'$ de latitud se trazarán con líneas rectas i sin necesidad de ocurrir al cálculo, que ántes se exijia, para determinar las

intersecciones de los meridianos i paralelos con las márgenes de las hojas. Por consiguiente, bastará dividir en 6 partes iguales las márgenes superiores e inferiores, i en 3 las laterales, i uniendo los puntos de dos en dos se obtendrán las cuadrículas correspondientes.

El orígen de las longitudes será el meridiano que pasa por el observatorio de Greenwich.

Se tomará el centro de cada hoja como origen de las coordenadas de los puntos que encierre.

Es necesario agregar que los centros de las hojas deben encontrarse siempre en las intersecciones de los meridianos correspondientes a los $15'$ i $45'$ con los paralelos $7'5$, $22'5$, $37'5$ i $52'5$ en cada grado, como se ve en la figura que sigue:

DETERMINACION GRÁFICA DE LOS PUNTOS

El eje de las x es el paralelo medio i el eje de las y es el meridiano medio de cada hoja.

La y depende de la diferencia de latitud del centro de la hoja i del punto que se considera; la x es la diferencia de longitud entre el punto i el centro mismo.

Los signos de las coordenadas rectilíneas son los mismos para las geográficas, como se ve en la figura anterior que representa el cuadro de una hoja o parcela.

La columna de las Tablas, titulada «Arcos de meridianos» da los valores en metros desde $1''$ hasta 1° de latitud, i la columna «Arcos de paralelos» da los valores desde $1''$ hasta $5'$ de longitud, pudiéndose obtener con estas últimas cantidades, ejecutando simples sumas o multiplicaciones, los valores hasta un grado.

Si se quisiera determinar las coordenadas rectilíneas de un punto cuya posición geográfica se da, bastará en-

contrar la diferencia entre las coordenadas geográficas del centro-origen i la del punto que se considera. Esta diferencia servirá de argumento para encontrar su valor en las Tablas i deducir los valores referidos a cada uno de los centros de cada parcela u hoja.

TABLAS PARA TRAZAR EL CONTORNO DE UNA HOJA CUALQUIERA
DEL MAPA DE CHILE EN PROYECCION POLIÉDRICA A LA
ESCALA DE 1 : 100,000.

TABLAS PARA LA PROYECCION DE MAPAS BASADOS SOBRE EL DESARROLLO POLICÓNICO CORRESPONDIENTE AL ESFEROIDE DE CLARKE, COMPUTADAS ENTRE EL ECUADOR I EL POLO.

(Del apéndice núm. 6 al *Report of U. S. Coast and geodetic Survey 1884*

Las Tablas presentes para la proyección de mapas en desarrollo policónico están basadas en las dimensiones i figura de la tierra aceptadas por el coronel Clarke en 1866. Estas Tablas están destinadas a reemplazar las publicadas anteriormente por la Oficina de Mensura, i por cuyo motivo, se ampliaron hasta completar el cuadrante entre el Ecuador i el Polo.

Hasta el año 1880 los elementos de magnitud i figura de la tierra, determinados por Bessel, fueron empleados en las representaciones de todas las posiciones geo-

gráficas, i sobre ellos se basan las tablas de proyección publicadas en las memorias de la Oficina de Mensura de la costa en 1853, 1856, 1859 i 1865. Estos elementos eran: en el Ecuador, el semi-eje $a = 6.377,397.2$ m., i en el Polo, el semi-eje $b = 6.356,079.$ m.

$$a : b :: 299 : 153 : 298 : 153$$

Las Tablas de proyección que aparecen en la Memoria de 1853, Apéndice 39, han sido las mas antiguas publicadas por la «Coast and geodetic Survey» i están acompañadas de una exposición del método i medios de emplearlas, i fueron preparadas por el asistente E. B. Hunt. En la Memoria de 1856, Apéndice 58, fueron publicadas las «Tablas para proyectar los mapas de gran estension», confeccionadas por J. E. Hilgard. Estas Tablas fueron ampliadas mas tarde por el mismo señor Hilgard i publicadas de nuevo en el Apéndice 33 de la Memoria de 1859; en seguida, con mayor estension, se hicieron las Tablas aplicables a la proyección del mapa de Norte América, publicadas en la Memoria de 1865, Apéndice 20.

En la Memoria de la Oficina de Mensuras de la costa i jeodesia de 1880, Apéndice 15, el ingeniero C. A. Schott dió en forma concisa i con bastante precision un estudio de gran importancia práctica, hecho con el objeto de comparar las diferentes proyecciones con la políónica.

En 1882 fué publicado por la Oficina de Mensura un «Tratado de proyecciones por Tomas Craig», en el cual se discuten i desarrollan los principios matemáticos en que están fundadas las distintas proyecciones. Habiéndose hecho muchas mensuras mas precisas en varias partes de

la tierra, notablemente en India, despues que Bessel publicó sus elementos durante los años 1837 i 1841, aquellos fueron comparados i combinados por el coronel A. R. Clarke en la Oficina de Mensuras oficiales de Gran Bretaña, publicadas en el volumen *Comparacion de unidades de medidas de lonjitud ejecutado en la Oficina de Mensura, en Southampton, en 1866.*

Da para los dos semi-ejes los valores siguientes:

$$a=6.378.206.4 \quad b=6.356.583.8$$

$$a : b :: 294.98 : 293.98$$

cuyas dimensiones corresponden a un esferoide de mayores dimensiones i escentricidad.

Estos elementos encontrados, que representan la curvatura i magnitudes resultantes, se acercan mucho a los de los trabajos trigonometricos de la Oficina de Mensura de la costa i jeodesia, no encontrándose cambios notables en las dimensiones generales que pudieran afectar a las del territorio de los Estados Unidos, siendo aceptables, por esta causa, para obtener la superficie jeneral de proyección de ese país.

En la Memoria de 1875, Apéndice 19, se publicaron Tablas para convertir ciertos coeficientes i arcos del esferoide de Bessel de 1866 al de Clarke, de Febrero de 1880; siendo aceptado formalmente el último para el uso de las mensuras. En el Apéndice número 7 del presente volumen se da una nueva edición de las Tablas para el cómputo de las latitudes, lonjitudes i azimutes jeodésicos.

Las fórmulas usadas para estas Tablas son las mismas que se emplearon para hacer las Tablas de proyección

de 1853 i 1856, introduciendo en ellas los nuevos valores numéricos correspondientes al esferoide.

Para los largos de grados de meridiano (D_m) i de paralelos (D_p), se obtienen ahora:

$$(I). D_m = 111132.09 - 566.05 \cos 2\varphi + 1.20 \cos 4\varphi - 0.003 \cos 6\varphi$$

$$(II). D_p = 111415.10 \cos \varphi - 94.54 \cos 3\varphi + 0.12 \cos 5\varphi, \text{ despreciando los términos pequeños, haremos que } \varphi \text{ represente la latitud.}$$

El valor del cuadrado de la excentricidad es igual a $e^2 = 0.006768658$

para la fórmula $e^2 = \frac{a^2 - b^2}{a^2}$

(III). El producto de la normal al eje menor:

$$N = \frac{a}{(1 - e^2 \sin^2 \varphi)^{\frac{1}{2}}}$$

(IV). Radio de curvatura en el meridiano:

$$R_m = N \frac{1 - e^2}{a^2}$$

(V). Radio del paralelo: $R_p = N \cos \varphi$.

(VI). Radio del paralelo desarrollado o lado de la tangente del cono: $r = N \cos \varphi$.

(VII). Si n es un arco cualquiera del paralelo por desarrollar i θ el ángulo que subtende en el vértice del cono despues de desarrollado, se tiene: $\theta = n \sin \varphi$.

(VIII). Para la proyección del meridiano medio i los

puntos de intersección de los meridianos i paralelos, usando las coordenadas rectangulares X i Y, tenemos:

$$X = r \operatorname{sen} \theta; Y = r \operatorname{sen}^2 \frac{1}{2} \theta.$$

Arreglo i disposicion de las tablas

Las tablas de proyecciones están arregladas de tal manera que cada hoja contiene los distintos valores para un grado cualquiera de latitud.

En la página de la izquierda se dan los valores de los arcos de paralelos para cada minuto de latitud i desde 1" hasta 5' de lonjitud.

En las primeras columnas están los valores correspondientes de todos los arcos de meridianos desde 1" hasta 1°, arreglados de tal manera para que los distintos valores intermedios puedan obtenerse con facilidad.

Si se desea saber la distancia en metros, entre la latitud $40^{\circ}05'25''$ i $40^{\circ}45'45''$, veremos en la Tabla en la latitud de 40° i en la columna encabezada «Suma de los minutos»:

| | |
|---|------------|
| Latitud $40^{\circ} 05' =$ | 9252.8 m. |
| Latitud $40^{\circ} 45' =$ | 83280.0 * |
| <hr/> | |
| Arco. | 74027.2 m. |
| Para la diferencia de 20", el valor es. | +616.9 * |
| <hr/> | |
| Largo del arco requerido= . . . | 74644.1 m. |

En la misma página se dan los valores de las coordenadas X i Y para las diferentes lonjitudes, hasta 5° a cada lado del meridiano central para la construccion de mapas segun el desarrollo policónico.

| LATITUD 18° A 19°—ARCOS DE PARALELOS EN METROS | | | | | | | | | | | | | | | Latitud 18° a 19° ARCOS DE MERIDIANOS | | | | Latitud 18° COORDENADAS | | |
